“Metadata” In SPICE Kernels

Also known as “comments”

January 2008

What are Metadata?

Navigation and Ancillary Information Facility

- **Metadata are information that describe the context of kernel data, i.e. “data about data”**
 - *“If you don’t write it down, it didn’t happen”*
- **Metadata are provided as plain text (prose)**
- **Examples of metadata:**
 - **Data descriptions**
 - » “This file contains representations of the trajectories for bodies X, Y and Z over the interval from launch to landing”
 - **Data accuracy**
 - **Data pedigree**
 - » **How and by whom was the kernel created**
 - The program(s) and/or steps used in creation
 - Contact information for user’s questions
 - email address
 - phone numbers
 - » **Data sources used as inputs when creating the kernel**
 - **Intended kernel usage**
 - **Companion files**
- **In SPICE, we often refer to metadata as “comments”**

Where are Comments Stored?

Navigation and Ancillary Information Facility

- **Binary kernels contain a reserved “comment” area**
- **Text kernels have comments interleaved with the data**
 - Comments may be placed at the beginning of the text kernel, before any data
 - Comments may be inserted between data using `\begintext` and `\begindata` as start and end markers

Adding Comments to Kernels

Navigation and Ancillary Information Facility

- **Binary Kernels**
 - Use the *commnt* utility program, available in the Toolkit
 - Include comment information at the time of kernel creation using SPICE modules (subroutines)
 - » This capability is not yet available in Icy or Mice
- **Text Kernels**
 - Use a text editor
 - » Begin comment sections with the “\begintext” marker alone on a line
 - (The marker is not needed for comments placed at the beginning of a text kernel)
 - » End comment sections with a “\begindata” marker alone on a line
 - (The marker is not needed if there are no data following the comments)
- **Restrictions**
 - For both binary and text kernels
 - » Comment line length limit is 255 characters. However, NAIF recommends using no more than 80 characters per line as this makes your comments far more readable!
 - » Use only printing characters (ASCII 32 - 126)
 - » Manipulating binary kernel comments requires the kernel be in the native binary format for the machine being used
 - For text kernels
 - » Refer to “Kernel Required Reading” (*kernel.req*) for details

Viewing Comments in Kernels

Navigation and Ancillary Information Facility

- **Binary kernels:**
 - Use either the *commnt* or *spacit* utility program
 - » Both are available in all Toolkits
- **Text kernels:**
 - Use any available text file utility, such as:
 - » more, cat, vi, emacs
 - » Notepad, TextEdit, BBEdit, Word, etc.

Viewing Comments in Binary Kernels

Navigation and Ancillary Information Facility

This example shows reading the comments

```
Terminal Window

prompt> commnt

Welcome to COMMNT Version: 6.0.1
(SPACE Toolkit N0062)

COMMNT Options

( Q ) Quit.
( A ) Add comments to a binary file.
( R ) Read the comments in a binary file.
( E ) Extract the comments from a binary file.
( D ) Delete the comments in a binary file.

Option: R

Enter the name of the binary file.

Filename? /home/mydirectory/myproject/kernels/spk/de403s.bsp
```

Filename must include any required path and contain no more than 255 characters

Viewing Comments in Text Kernels

Navigation and Ancillary Information Facility

```
Terminal Window
prompt> more naif0008.tls

KPL/LSK

LEAPSECONDS KERNEL FILE
=====

Modifications:
-----
2005, Aug. 3   NJB   Modified file to account for the leapsecond
                  that will occur on December 31, 2005.

1998, Jun 17   WLT   Modified file to account for the leapsecond
                  that will occur on December 31, 1998.

1997, Feb 22   WLT   Modified file to account for the leapsecond
                  that will occur on June 30, 1997.

...etc.
